Agent Build Task

Build a working HR agent on Lua

You are building for a **50,000-employee industrial conglomerate** headquartered in Riyadh, with operations across the UAE, Egypt, and Jordan. They have **zero HR technology** in place – everything today is manual, paper-based, or handled through scattered WhatsApp messages between HR coordinators.

Leadership has approved a digital transformation starting with **HeyLua.ai** as the intelligent agent layer and **BambooHR** as the core HRIS (chosen for its well-documented open API covering employee records, onboarding checklists, leave tracking, and time-off management).

Your task

Build a fully functional HR agent on Lua that handles two of the four core workflows below.

1 Onboarding

Walk new hires through document collection (Iqama copy, bank details, emergency contacts), trigger onboarding checklists in BambooHR via API, assign orientation schedules by entity and location, and answer policy questions from a loaded knowledge base covering Saudi labour law, Nitaqat / Saudization requirements, and country-specific probation terms for KSA, UAE, Egypt, and Jordan.

2 Leave Management

Employees request annual, sick, or emergency leave through the agent in Arabic or English. The agent checks leave balances via the BambooHR API, applies the correct entitlement rules by country (e.g. 21 vs 30 days annual leave in KSA based on tenure), routes approvals to the correct line manager, and confirms or rejects with a notification back to the employee.

3 SOP Requests

Employees can ask the agent for any HR standard operating procedure – transfer requests, salary-certificate issuance, exit and re-entry visa process, housing allowance policy, and so on. The agent retrieves answers from a knowledge base you build and load with mock SOP documents. If no SOP exists for the request, the agent logs it as a gap and escalates to HR.

4 Daily Performance Management

No system exists for this yet. The agent collects daily check-ins from team leads: what was accomplished, blockers, and a 1-5 productivity rating per team member. All data is pushed to a Google Sheet via API that serves as a live dashboard. The agent should also be able to pull weekly summaries on request (“How did Ahmad’s team perform this week?”).

What your build must demonstrate

- ▶ **Skills** – gratuity calculation, Iqama expiry alerts, and bilingual Arabic / English handling.
- ▶ **Integrations** – BambooHR API and Google Sheets API.
- ▶ **Knowledge base** – loaded with mock HR policies and SOPs.
- ▶ **Multi-channel deployment** – a web portal for office staff and WhatsApp for field workers.
- ▶ **Architecture walkthrough** – use a tool like Loom to voice over a walkthrough of the full architecture of what you build.

SUBMISSION

Please reply to our email with the following two links:

1. A link to your **repository**.
2. A **Loom video**, 10 minutes maximum.

Thank you for your interest in working with Lua.
